Alvaro Scelza

Backend & AI Engineer

Python/AWS, building LLM features in production (Claude, Bedrock, RAG). Currently at Blend360, embedded at Blackstone.

Montevideo, Uruguay (UTC-3) · Remote · Italian citizen (EU work authorization)

Fluent in Spanish & English

Experience

Blend360 — Software Engineer *Apr 2026 – Present*

• Co-created Bifrost: a config-driven platform that lets Claude work across the data, API, and UI repos a feature needs, past the single-repo limit of our ONA dev environments. It routes the agent through specialized roles, developer commands, task-triggered skills and per-repo maps loaded only when a task needs them, keeping the always-loaded context small (core rules file cut from 231 to 106 lines with no rule lost). It connects to Jira, Confluence, and Snowflake, and an automation I built on ONA's dotfiles loads each developer's Claude config from a private repo (isolated per person, editable with Claude, versioned). Used by engineers and PMs on the team (PMs for design and Jira work), with 4 other teams requesting access or adopting its approach for their own setups.

• Built a unified activities calendar end to end: one dbt data source in Snowflake feeding a C#/.NET API and a React UI with map, day and grid views.

• Recognized by the client's SVP in Blend360's client satisfaction (NPS) survey for improving developer effectiveness across the team: reducing friction in how engineers build, test, and deliver, with reusable approaches that benefit engineers beyond any single project.

Promtior — Full-Cycle Software Engineer · Contract (client engagement) *Dec 2025 – Apr 2026*

• Solo-built a self-service serverless CSV ingestion platform and delivered it in two months, from architecture through production. I was the primary technical contact with the client. The client then signed an ongoing (initially one-year) engagement; Promtior formed a larger team for it, which I joined.

• Five Lambda functions stream files from S3. Files are up to 500k rows and 100MB. Amazon Bedrock (Claude Opus 4.5) maps columns across different CSV layouts.

• React SPA with a 3-step wizard, presigned-URL uploads, and processing status. Infrastructure is Terraform, GitHub Actions, and Secrets Manager; tests are pytest with AWS mocks (AAA), plus technical documentation. Client onboarding went from 40+ hours to 15 minutes, without an engineer in the loop, and past the previous 7-partner limit.

Sep 2025 – Nov 2025 — Career break: built personal products (Tabellio, FinApp)

Amoeba AI — Software Engineer · Early-stage startup *Apr 2025 – Aug 2025*

• Joined as one of the first software engineers. Built a Pipes and Filters pipeline on AWS Lambda that ingests and processes financial files on Amoeba's Pulse engine, for real-time ROI optimization in marketing and finance workflows.

• Built a production RAG chat (Claude, OpenAI) over proprietary financial datasets. It returns recommendations, business-hypothesis simulations, and next steps. I cut that customer-facing agent's response time by 40%.

• Integrated those AI tools with the revenue workflows used for campaigns and customer lifecycle.

Elastic Hotel — FullStack Software Engineer *Mar 2023 – Apr 2025*

• One of three core engineers on Elastic Hotel's revenue platform for European hotels (dynamic pricing and analytics, including Kondo OS), used by hotels generating over €263M in revenue.

• Proposed and led the move from Flask to Django (Django-React) on the monolith. CI/CD on Terraform and AWS made the feature deployment cycle 30% faster.

• Built a review-rating model at 87.97% test accuracy and added it to the analytics suite, then further models for data normalization and demand forecasting.

CreateThrive — FullStack Software Engineer *Jan 2022 – Feb 2023*

• Led Sunpower InstantDesign (one of CreateThrive's biggest clients). It generates residential solar-panel grids with CUDA and neural networks. I ran Docker Compose, wired the IDE to the containers, and built Flask API endpoints with a React/Vue UI for internal testing. The system was about 3 years old and the original team had left; I worked on maintenance and technical debt.

Ripio — Team Leader *Feb 2020 – Dec 2021*

• Led a new team for OTC, Ripio's desk for VIP clients with large transaction volumes, while Ripio split the monolith into smaller teams.

Banco de Previsión Social — Software Developer *2018 – 2020*

• Spent two years on Project GRP, the social-security ERP on Odoo and PostgreSQL: customization and maintenance for government requirements.

Universidad ORT Uruguay — Professor of Programming I *Aug 2018 – Dec 2018*

• Taught Programming I at Universidad ORT Uruguay with Java and NetBeans.

Dirección Nacional de Migración — Technical Support - Software Development *Dec 2014 – 2018*

• In August 2016 I built Procedures Record v1, a PHP / Smarty / MySQL backoffice for the immigration procedures handled by Dirección Nacional de Migración.

Education

Universidad ORT Uruguay — Engineer's degree, Computer Software Engineering (2012 – 2019).

Key Technologies

Backend: Python, C#/.NET, Dapper, Django, Flask, Node.js.
AI/LLMs: Claude, Bedrock, RAG, OpenAI.
Data: dbt, Snowflake, Fivetran, Flyway.
Frontend: React, JavaScript, TypeScript.
Databases: PostgreSQL, MySQL, DynamoDB, MongoDB, SQL Server.
Cloud: AWS, Lambda, S3, EC2, API Gateway, SQS, CloudWatch, Secrets Manager, Azure, GCP.
DevOps: Terraform, Docker, GitHub Actions, Git, GitLab.

Certifications

Claude Partner Badge - Claude Code — Anthropic, via Credly. Issued October 27, 2026. Expires April 27, 2027.
Anthropic courses (2026): Claude Code in Action, Building with the Claude API, Introduction to Model Context Protocol, Introduction to agent skills, AI Fluency: Framework & Foundations.
