Experience

Blend360 — Software Engineer *April 2026 - Present*

Co-created Bifrost on my own initiative: a config-driven platform that lets Claude work across the data, API, and UI repos a feature needs, past the single-repo limit of our ONA dev environments. It sets shared team rules, connects to Jira, Confluence, and Snowflake, and an automation I built on ONA's dotfiles loads each developer's Claude config from a private repo (isolated per person, editable with Claude, versioned). Adopted by the entire ICS team (8 people, from engineers to PMs and design), with 4 other Blackstone teams requesting access or adopting its approach for their own setups.

Promtior — Full-Cycle Software Engineer · Contract (client engagement) *December 2025 - April 2026*

Solo-built a self-service CSV ingestion platform and delivered it in two months, from architecture through production. I was the primary technical contact with the client. The client then signed an ongoing (initially one-year) engagement; Promtior formed a larger team for it, which I joined.

Sep–Nov 2025 — Career break: built personal products (Tabellio, FinApp)

Amoeba AI — Software Engineer · Early-stage startup *April 2025 - August 2025 (5 months)*

Joined as one of the first software engineers. Built a Pipes and Filters pipeline on AWS Lambda that ingests and processes financial files on Amoeba's Pulse engine, for real-time ROI optimization in marketing and finance workflows.

Elastic Hotel — FullStack Software Engineer *March 2023 to April 2025 - 2 years 2 months*

With two other developers, built on Elastic Hotel's revenue platform for European hotels (dynamic pricing and analytics, including Kondo OS). The platform is used by hotels generating over €263M in revenue.

CreateThrive — FullStack Software Engineer *January 2022 to February 2023 - 1 year 2 months*

Led Sunpower InstantDesign (one of CreateThrive's biggest clients). It generates residential solar-panel grids with CUDA and neural networks. I ran Docker Compose, wired the IDE to the containers, and built Flask API endpoints with a React/Vue UI for internal testing. The system was about 3 years old and the original team had left; I worked on maintenance and technical debt.

Ripio — Team Leader *February 2020 to December 2021 - 1 year 11 months*

Led a new team for OTC, Ripio's desk for VIP clients with large transaction volumes, while Ripio split the monolith into smaller teams.

Banco de Previsión Social — Software Developer *2018 to 2020 - 2 years*

Spent two years on Project GRP, the social-security ERP on Odoo and PostgreSQL: customization and maintenance for government requirements.

Universidad ORT Uruguay — Professor of Programming I *August 2018 to December 2018 (5 months)*

Taught Programming I at Universidad ORT Uruguay with Java and NetBeans.

Dirección Nacional de Migración — Technical Support - Software Development *December 2014 to 2018*

In August 2016 I built Procedures Record v1, a PHP / Smarty / MySQL backoffice for the immigration procedures handled by Dirección Nacional de Migración.

Education

Universidad ORT Uruguay — Engineer's degree, Computer Software Engineering (2012–2019).

Key Technologies

Backend: Python, Django, Flask.
AI / LLMs: Claude, Bedrock, RAG.
Frontend: React, JavaScript, TypeScript.
Database: PostgreSQL.
Cloud: AWS, Azure.
DevOps: Terraform, GitHub Actions.

Certifications

Claude Partner Badge - Claude Code — Anthropic, via Credly. Issued October 27, 2026. Expires April 27, 2027.
